To:

The present invention comprises a printer system for a device that comprises a secure compartment and a top surface positioned at an acute angle relative to a floor. A portion of the secure compartment includes interior of an opening from the top surface. The printer system comprises a support frame attachable to the device and positioned in the secure compartment of the device. The support frame comprises at least one glide rail. The printer system further comprises a printer assembly attached to the support frame. The printer assembly comprises a media holder adapted to hold printable media, a chassis intermediate and attached to the media holder, and a printer attached to the chassis and adapted to print on the media. In a first position, the printer assembly is positioned substantially inside the secure compartment. In a second position, the printer assembly is extended away from the secure compartment.

In the claims:

15 Please amend claim 1 from:

1. A printer system for a device, the device comprising a top surface displaced at an acute angle relative to a floor, the device further comprising a secure compartment, wherein a portion of the secure compartment includes interior of an opening from the top surface, the printer system comprising:
 - 20 (A) a support frame, the support frame being displaced in the secure compartment, the support frame being attachable to the device, the support frame comprising at least one glide rail attached to the support frame; and
 - (B) a printer assembly attached to the support frame, the printer assembly comprising:
 - (a) a media holder, the media holder being adapted to hold printable media;

- (b) a chassis intermediate and attached to the media holder; and
- (c) a printer attached to the chassis, the printer being adapted to print on the media;

wherein in a first position the printer assembly is displaced substantially inside the secure compartment, wherein in a second position the printer assembly is extended away from the secure compartment.

To:

1. A printer system for a device, the device comprising a top surface positioned at an acute angle relative to a floor, the device further comprising a secure compartment, wherein a portion of the secure compartment includes interior of an opening from the top surface, the printer system comprising:

(A) a support frame, the support frame being positioned in the secure compartment, the support frame being attachable to the device, the support frame comprising at least one glide rail attached to the support frame; and

(B) a printer assembly attached to the support frame, the printer assembly comprising:

- (a) a media holder, the media holder being adapted to hold printable media;
- (b) a chassis intermediate and attached to the media holder; and
- (c) a printer attached to the chassis, the printer being adapted to print on the media;

wherein in a first position the printer assembly is positioned substantially inside the secure compartment, wherein in a second position the printer assembly is extended away from the secure compartment.

Please amend claim 19 from:

19. A method of situating a printer system inside a portion of a secure compartment of a device, the device comprising a top surface displaced at an acute angle relative to a floor, wherein the portion of the secure compartment includes interior of an opening from the top surface, the method comprising:

(C) providing a support frame displaced in the secure compartment, the support frame comprising at least one glide rail, the glide rail having an entry end and a stopping end;

(D) providing a print assembly, the print assembly comprising a media holder, a chassis attached to the media holder, and a printer attached to the chassis;

(E) attaching the media holder to the glide rail of the support frame; and

(F) sliding the media holder from the entry end to the stopping end of the glide rail thereby allowing the print assembly to be situated substantially inside the secure compartment,

wherein media from media holder travels in a substantially vertical direction from holder to the printer, wherein the print assembly remains movable away from the secure compartment by sliding the media holder from the stopping end to the entry end.

To:

19. A method of situating a printer system inside a portion of a secure compartment of a device, the device comprising a top surface positioned at an acute angle relative to a floor, wherein the portion of the secure compartment includes interior of an opening from the top surface, the method comprising:

In re application of: Robert A. Luciano, Jr. et al.
Serial Number: 10/090,115
Page 8

- (A) providing a support frame positioned in the secure compartment, the support frame comprising at least one glide rail, the glide rail having an entry end and a stopping end;
- (B) providing a print assembly, the print assembly comprising a media holder, a chassis attached to the media holder, and a printer attached to the chassis;
- (C) attaching the media holder to the glide rail of the support frame; and
- (D) sliding the media holder from the entry end to the stopping end of the glide rail thereby allowing the print assembly to be situated substantially inside the secure compartment,

wherein media from media holder travels in a substantially vertical direction from holder to the printer, wherein the print assembly remains movable away from the secure compartment by sliding the media holder from the stopping end to the entry end.

Please amend claim 26 from:

26. A mount for vertically mounting a printer inside a secure compartment of a device, the device comprising a top surface displaced at an acute angle relative to a floor, the mount comprising:
- (A) a support frame, the support frame attachable to the device;
- (B) a media holder vertically attached to the support frame, the media holder comprising a plurality of walls, the walls being configured to form a substantial enclosure to hold printable media, the walls defining a cavity on at least one side of the media holder,
- wherein the media holder is adapted to be attachable to printer intermediate to the media holder.

To:

26. A mount for vertically mounting a printer inside a secure compartment of a device, the device comprising a top surface positioned at an acute angle relative to a floor, the mount comprising:

- (A) a support frame, the support frame attachable to the device;
- (B) a media holder vertically attached to the support frame, the media holder comprising a plurality of walls, the walls being configured to form a substantial enclosure to hold printable media, the walls defining a cavity on at least one side of the media holder,

wherein the media holder is adapted to be attachable to printer intermediate to the media holder.

Please amend claim 27 from:

27. The mount of claim 26, further comprising
- (A) a glide rail displaced on the support frame, the guide rail having an entry end and a stopping end;
 - (B) a roller attached to the media holder, the roller being retained by the glide rail, wherein when the media holder is moved from between the entry end and the stopping end of the guide rail, the roller travels on the glide rail.

To:

27. The mount of claim 26, further comprising
- (A) a glide rail positioned on the support frame, the guide rail having an entry end and
